

TANKS, *Hobsonville, NZ*

AQURON 300 was used on the Hobsonville Tank project along with an applied membrane to enhance the durability of the concrete in this harsh environment. Chemical attack and scour action can dramatically reduce the service life of concrete structures exposed to chemical and physical attack and AQURON solutions have been used for over 20 years to ensure these service life demands are met.

AQURON 300 also ensured the self compacting concrete characteristics were enhanced allowing insitu stitch infills to be poured around congested reinforcing in one pour.

REQUIREMENTS:

- **Waterproofing**
- **Durability Enhancement**
